

Automated cyber security awareness training and simulated phishing

Human error has become the biggest threat to the security of your network so that even with the most advanced security deployed on devices and networks, it only takes one miss-click to open the backdoor to a cyber attack. As long as your end users have access to your company systems, no matter what technical or software solutions you have in place, a cyber criminal can dupe an employee into undermining your security and cause a breach.

- **97%** of malware attacks use social engineering to exploit users
- **91%** of successful cyber attacks are the result of phishing

It is hard to escape the fact that our staff are often the single point of failure of our network's security and that raising awareness and improving knowledge is the most effective solution. Most of us don't have inhouse security experts to deliver effective computer security training to our staff. Deploying uSecure enables you to ensure your users are educated on all aspects of computer security awareness.

"If there is one thing you look at adding to your security this year it should be user awareness training, it's difficult to stress too much how essential our staff have become in maintaining our security.

Leaving them to this untrained is a risk we should not be taking. It may

even be irresponsible for those who are tasked with securing your company's data not to be doing so."

Five Solutions, One Package...

uLearn

New users and new starters begin by completing their online assessment, uLearn then builds a course tailored to each individual. This course is delivered monthly in bite-sized courses across the year to improve weaknesses and strengthen your overall security, whatever level of experience your users start with.

uPhish

Schedule a series of phishing tests throughout the year, customised to your company, users and/or departments. Select from a variety of themes, create your own or let us assist (as part of our supported option), in order to deliver regular, appropriate testing of your users' phishing awareness.

uBreach

How many of your users reuse their company email address or passwords outside of work parameters? uBreach reveals the forums, data dumps and data breaches that your company's email addresses and domains have been exposed in, enabling you to deliver training or mitigate the risk by amending passwords, email addresses or user details.

uPolicy

Many of us are now delivering a variety of policies (security and other) to our staff. These must be maintained, updated and agreed to by users. uPolicy enables policy storage, amendment, distribution and management, tracking which users have seen and signed policies and delivering reminder emails where they have not.

RiskScore

Ongoing monitoring of your security awareness is essential in order to celebrate improvement as well as highlight weaknesses. RiskScore delivers individual, department and company-wide performance information and security grades to see the overall insider threat level to your business.

Simply Secure

Often the complexity of deployment and management of security awareness platforms erodes their effectiveness, if not initially, certainly over time. uSecure is built as a “hands off” platform meaning that once your portal is configured and you have chosen your training schedule, existing and new staff members are onboarded, delivered custom training, tested and monitored throughout the year, whenever they join the scheme. Integration into Office365 can even automate the addition of users when they are added to your estate.

Pricing

uSecure pricing is simple, paid for on a per user, per month basis and flexible to meet your growing (and shrinking) needs, the minimum license count is only 10 users and the minimum period only 3 months.

[Want to deliver uSecure to your customers? Get in touch!](#)

“User security awareness training must be effective, but equally it must be simple to deploy, maintain and manage. uSecure delivers this beyond any security awareness solution we have seen. Literally within a few clicks you can be deployed, discovering your staff’s weaknesses and delivering tailored training and testing, not just once, but consistently throughout the year.”

COVID 19 Work from home training: All customers get all uSecure content and courses included in their package. For example, with the recent change in working habits caused by Covid-19, additional courses have been created to deliver training for staff on remote access and the increased risks when working from home.
